

# Rubber Egg Experiment

## Materials you'll need

- Raw eggs
- Vinegar
- Food colouring (optional)

## How to Make the Eggs

1. Place each egg in a container big enough to lift the egg in and out and cover with cling film.
2. Add enough vinegar to cover the eggs. You can add food colouring too if you have any.
3. Leave the eggs for 3-5 days.
4. After 3 days, carefully lift the eggs out of the vinegar and gently rinse under running water. The last pieces of egg shell should wash off and leave you with rubber eggs.

## Sensory Play

Roll an egg in your hands, it should be slightly squishy but firm at the same time. (Not too hard as it will pop)

Hold an egg above a bowl or plate and let it fall. Start small and gradually increase the height, it should bounce.

Get a large container and put it on the ground. Test how high you can drop the egg into the container before it bursts.
